testimonies from hundreds of veterans suggest Vietnam War defoliants were stored, sprayed and buried throughout the island.

In 2014, all components of Agent Orange were discovered at a former military dumpsite in Okinawa City. In June 2015, nearby water was found to be contaminated with dioxin, the poison which makes defoliants dangerous, at 21,000 times safe levels.

*Workers at the U.S. military dioxin dumpsite near Kadena Air Base, Okinawa.
November 2016. Jon Mitchell*

The U.S. Department of Veterans Affairs has reluctantly begun to award compensation to veterans claim exposure on the island. To date, at least seven service members have been granted assistance – include those exposed on Kadena Air Base, Naha Military Port and the Northern Training Area.

However because the Pentagon denies defoliants were ever present on Okinawa, many more veterans have been refused support from the VA.

Now new evidence has emerged on the usage of defoliants on Okinawa: interviews with the veterans who inventoried them at Kadena Air Base, indications that missing supplies of Agent Pink, a defoliant more toxic than Agent Orange, ended up on the island and the case of a U.S. Airman whose death in 2014 suggests dioxin contamination remains a very current danger for Okinawa today.

During the Vietnam War, Kadena Air Base was one of the busiest airports on the planet as an estimated million military flights shuttled troops and supplies to the conflict. Such a massive operation required a organized logistical workforce; two of those involved were Allan Davis and his future wife, Eileen.

Allan was stationed at Kadena with the 824th Supply Squadron from 1968 to 1971.

"I was responsible for counting and inventorying Agent Orange. It came to the ports at Naha and other locations on Okinawa. The barrels had federal stock numbers and were entered into the base computer system."

Eileen, a USAF computer specialist, worked at Kadena Air Base between 1969 and 1971; her duties involved making records of all assets on the installation, including Agent Orange.

"Agent Orange was sprayed as a weed killer for vegetation control around the perimeter of the military base and I was subject to herbicide exposure."

Today both husband and wife are sick with illnesses they believe were caused by Agent Orange; Eileen suffered a miscarriage, their surviving son was born with a birth defect and she required a hysterectomy the age of 25.

Corroborating the Davis's assertions that Agent Orange was present at Kadena is a 1971 [U.S. Army report](#) produced by Fort Detrick, the center for the Pentagon's bio-chemical weapons research. Titled "Historic logistical, political and technical aspects of the herbicide/defoliant program," the document details the military's herbicide campaign against Vietnam and it cites a stockpile of herbicides at Kadena Air Base.

Kadena Air Base has a history of contamination stretching back decades. Jon Mitchell.

Other veterans were exposed there, too.

According to VA records, a U.S. Marine truck driver who transported barrels of Agent Orange from Okinawa ports for storage at Kadena Air Base between 1967 and '68, developed prostate cancer as a result of his exposure. The VA awarded him compensation in 2013.

However the Davis's are facing an uphill struggle to receive similar assistance because, according to VA regulations, prior decisions do not set a precedent for other cases.

So just how many veterans have claimed they are sick from Agent Orange exposure on Okinawa?

The VA says it doesn't keep records.

In response to a request under the U.S. Freedom of Information Act, in May 2015 Bertha Brown, Compensation Service FOIA officer, stated the Veterans Benefits Administration "does not track claims for Agent Orange (AO) exposure based on Okinawa service."

But the Board of Veterans Appeals maintains a publicly-accessible [database](#) of rulings. Detailed search results reveal at least 250 service members have filed plausible claims for compensation for exposure to Agent Orange. This website uses cookies to enable certain functions and to improve your user experience. By continuing to

browse the site you are agreeing to our use of cookies. [Accept](#) [More Information](#)

However, these 250 are merely the tip of the iceberg. The database only lists cases which the VA initially rejected then the veteran chose to appeal – and a ruling was reached. Unknown is the number of veterans who applied for help in the first place, those who were immediately awarded benefits, those who chose to appeal their denials or those who died before they could do so. Some claims can take up to a decade for a verdict to be reached. This has given rise to a saying among veterans: “The VA will delay and deny until we are all dead.”

In some of the cases where Okinawa veterans have won their claims, the deciding factor has been testimonies – or “buddy statements” – from fellow service members. To collate such accounts and assist those exposed, the author has begun to collate such statements on his homepage [here](#).

New information suggests that Agent Orange was not the only – or the worst – defoliant sprayed on Okinawa.

During the Vietnam War, the U.S. military used at least 12 different types of herbicides in southeast Asia to clear crops and destroy jungle where enemies could hide. Many of these defoliants were stored in barrels painted with colored stripes which identified their formulae and lent them their nicknames; for example Agent Orange, the most commonly-used defoliant.

Another of these defoliants was Agent Pink. In 2003, the scientific journal, [Nature](#), estimated Agent Pink contained dioxin at an average of 65.5 parts per million – a concentration of up to 22 times higher than Agent Orange.⁷ Researchers also revealed the Pentagon had ordered at least 464,000 liters of Agent Pink but USAF only had records for spraying 50,000 liters; the remainder was missing.

Now it appears that some of that Agent Pink found its way to Okinawa.

Between 1975 and '76, U.S. Marine Daniel Glanz was stationed on Camp Foster. During this time, he witnessed Marines and Okinawan base workers spraying herbicides around the barracks.

Glanz also saw the barrel from which they filled their equipment.

“None of us ever exchanged dialogue concerning the presence of the barrel, but the pink band around its middle stood out like a neon sign. We understood its purpose but gave little thought as to its potential harm to us.”

Glanz only realized the significance of what he had seen many years later when he heard about Caethe

Goetz, whose account was reported by [The Japan Times](#) in August 2011, was a Marine stationed at Carr Foster at the same time as Glanz. Sprayed with herbicides while walking on the base, she developed multiple myeloma which her doctors believed was a result of dioxin poisoning. Her children and grandchildren also developed illnesses associated with chemical exposure.

As with so many other veterans, Goetz's claims were denied by the U.S. government. She continued to campaign for the military to come clean about its usage of defoliants on Okinawa until her death in November 2012.

Throughout the mid-1970s, Okinawa was inundated with surplus supplies from the war in Vietnam including herbicides, pesticides and solvents. According to [documents](#) released in 2015 under FOIA, careless storage of these chemicals at Machinato Service Area (today named USMC Camp Kinser) caused a series of fish and widespread contamination from dioxin, the toxic pesticide DDT and carcinogenic PCBs.

The author at Yomitan Village Hall, Okinawa, where he lectured on military contamination. November 2016.

In recent years, wildlife trapped near Camp Kinser showed high levels of PCBs and DDT, suggesting the base is still contaminated today.

An 8700-page [cache of military reports](#) also obtained under FOIA reveal extensive ongoing contamination on Kadena Air Base, too. The documents reveal pollution from substances including PCBs, dioxin, PFOS asbestos and lead.

Alarmingly obvious in these Kadena Air Base reports is the negligence with which the military acted on installation throughout much of the twentieth century. No records had been kept for the disposal of tox

Lax safety standards at Kadena Air Base might now be returning to haunt the 20,000 USAF members and their families living and working on the installation.

"John loved the Air Force. He was a true hero and a patriot who gave his life for his country. But he has received no recognition for his sacrifice because the military won't acknowledge the cause of his disease."

Jennifer Agger's husband, John, spent a total of six years on Kadena Air Base, with his final tour ending in 2006.

In 2014, at the age of 36, he died of pancreatic cancer.

Since the disease was so unusual for a man of his age, post-mortem tests were ordered. They revealed levels of dioxin in his tissue so high, his doctor noted, that "if found in a food, would be 2-3 times above acceptable safety limited for consumption."

The same doctor surmised: "the evidence seems to me very strongly suggestive of a link between John's pancreatic cancer and his exposure to dioxins."

Determined to alert current service members stationed at Kadena Air Base of the risks, Jennifer took the post-mortem results to her congress member who contacted the USAF. "I received essentially a canned statement from the USAF. Even after reiterating my concerns, I received a second letter that was word for word the same."

Such opacity seems sadly all too common.

Among the veterans I've interviewed during the past five years, three of them – including Goetz – have been waiting for the military to respond to the concerns of themselves or their families. Scott Parton, the shirtless Marine pictured in the now well-known photograph of a barrel of Agent Orange at Camp Schwab, died in April 2013. Gerald Mohler, a Marine exposed to herbicides near Camp Courtney, died in September 2013.

It seems Okinawan residents have also been exposed.

In July 1968, 230 Okinawan children swimming at a beach in Gushikawa (today Uruma City) suffered chemical burns to their bodies. According to a U.S. soldier and Okinawan base employee, the shoreline had recently been sprayed with large volumes of Agent Orange to clear vegetation. Dozens of deformed frogs had also been discovered in the vicinity.

At Camp Schwab, high rates of cancers among employees have been attributed to the defoliants they ordered to spray in the 1960s and '70s.

Given the persistence of dioxin below ground, it is unsurprising that the number of former military sites where it has been detected is rising. The soccer pitch in Okinawa City where 108 barrels were found. A residential area in Chatan. An old airfield in Yomitan. A shuttered military housing area at Nishi Futenma.

Because SOFA does not allow checks within bases, nobody knows the extent of dioxin contamination on currently-operational U.S. installations. Likewise the Okinawa prefectural authorities and Japanese government have never conducted any epidemiological surveys of local residents or former military employees.

Masami Kawamura, director of the [Informed-Public Project](#), an Okinawa-based organization working on environmental issues, blames this on apathy at both the prefectural and national level.

In 2012, prefecture officials indicated they'd consider running health checks if firm evidence of contamination was ever discovered, she explains. "But even after high levels of dioxin were discovered in Okinawa City did nothing. It is as if they don't want to create extra work for themselves."

"Also Okinawa Defense Bureau tries to downplay the severity of contamination. They take the side of the U.S. government over the side of Okinawan residents. That's why they hire scientific experts chosen to deny the presence of defoliants."

Debbie Jonson

I remember in 1971 watching flatbed trucks with barrels stacked high moving from Kadena to Naha...Mili police blocking the intersection. My step-father was stationed at Kadena and his only comment was that those barrels were headed for Johnston Island and we needed to stay as far away as possible.

JON MITCHELL

British journalist Jon Mitchell has been investigating contamination on U.S. military bases in Japan since 2010. This research won him the Foreign Correspondents' Club of Japan Freedom of the Press Award for Lifetime Achievement in 2015. He is the author of the Japanese language book, Tsuiseki: Okinawa no Karehazai (Chasing Agent Orange on Okinawa) and a visiting researcher at the International Peace Research Institute of Meiji Gakuin University, Tokyo. Mitchell is a correspondent at Okinawa Times. Mr. Mitchell serves on the Civilian Exposure Advisory Board and is also a contributor for our Civilian Exposure Okinawa military contamination coverage.
